

DIGITAL CAMERA COMPRISING WHITE-BALANCE SENSOR

ABSTRACT OF THE DISCLOSURE

5 A digital camera has a compact front surface due to a
white-balance sensor and an electronic flash device being
connected to each other, as one rotatable body. Further, both the
light accepting angle and the illuminating angle are automatically
adjusted to correspond to an angle of view, by movement of the
10 rotatable body. Therefore, a camera comprising a zooming system
is able to adjust the white balance, and emit stroboscope light
efficiently.
